SECTION 1

What changed in 3.3

Ride Partner became **Training Partner**: one app for riding, running, swimming and gym work. Everything below was changed in this version.

All your sports
Runs from Strava; pool swims, treadmill runs, the gym bike, elliptical, stair stepper, rowing machine and strength sessions straight from the Galaxy Watch through Samsung Health. Each sport has its own colour and icon (Ride Run Swim Gym & other), its own numbering (Ride 42, Run 2, Swim 1 — since 3.9 gym and other sessions per exercise: Strength 3, Elliptical 1) and its own units (km/h for rides, pace per km for runs, pace per 100 m for swims).

New activity inbox
Types the app doesn't import by default — walks, hikes, yoga, football… — wait in an inbox on the Training screen. Include them (walks and hikes count as runs — since 3.5 as Walks — everything else as Gym & other) or skip them, and optionally remember the choice for that type.

Only 2026 onwards
Strava and Samsung Health imports ignore anything before 1 January 2026.

Mark wrong data
The flag on every workout (and on every record) opens a sheet: change the sport, mark it indoor, mark climbing, distance/speed, heart rate or power as a data error, exclude it, or delete it. Original numbers are kept; flagged values are simply left out of records, best efforts, trends, totals and AI context.

Delete workouts
Deleting creates a restore point first and remembers the workout so sync never brings it back.

Charts fixed
Charts no longer disappear after changing a filter, a metric pill, or coming back to a screen. Charts can't trap your scroll any more, and chart-heavy screens draw after the screen transition so the tab never feels frozen.

Compare really compares
Same-sport sessions, "latest vs most similar" by default (accidental recordings skipped), a one-line verdict, efficiency (speed per heartbeat), paired bars, heart-rate zones side by side and a speed/HR overlay chart.

Model per coach, two-level picker
Tap the model line in any coach → a provider (e.g. Google Gemini) → its models. Choose "Use another provider" (automatic fallback) or "Keep retrying this one" (only that model, retried with growing pauses until it answers). Every reply shows the model that wrote it and how long it took.

Messages are never lost
Your message is saved the instant you send it. Leaving the chat or the app doesn't stop the reply; unanswered messages are retried automatically when the app comes back or the connection returns.

Coach memory
Facts and corrections ("that ride was a stationary gym bike") are saved and given to every coach. Coaches add facts themselves when you correct them; you can add or delete them in Profile → Coach memory.

Better AI answers
Reply rules from a review of your real conversations: answer first, ~150 words for chat, no hype, no repeated closing questions, weight only when relevant, no invented numbers or sessions, honest about missing data. "No bike this week" now means other sports, not rest. Timelines show each minute's peak values, not only averages.

More complete, more compact context
Aether sees every workout: the last six weeks one by one (with your note and the coach's verdict from that session's chat), older ones as weekly/monthly totals, plus a "data completeness" line. A bug that gave every Gemini model the reduced "small model" context ("ge**mini**") is fixed.

Samsung Health improvements
Resting heart rate is estimated from the watch's heart rate (Samsung doesn't share a resting value), the coaches are told when sleep wasn't recorded instead of treating it as bad sleep, and HRV is reported as unavailable.

Reports & PDF
Choose All / Rides / Runs / Swims / Gym. The PDF now has a cover band, coach verdict, KPI tiles vs the previous period, each sport, fitness/fatigue and weekly-volume charts, an intensity donut, a week-by-week table, a page per sport (trend chart, zones, top sessions), highlights & records, plan adherence, a recovery log, data-quality notes, coach memory, the review and every session.

Every sport its own numbers (3.4)
Swims: SWOLF, strokes per length, stroke rate, stroke mix, rest, best 50–400 m, per-length chart and 100 m splits. Runs: cadence, steps, VO2max. Gym: time, heart rate, load, calories, reps. Feed, detail, Trends, records, Compare, Reports, PDF and the AI coaches use only what fits each sport.

Motion
Screens slide in the direction you move, a tapped workout grows into its detail page, numbers roll up, routes draw themselves, a light sweep crosses the week card, the tab indicator slides, buttons ripple, and new records get confetti. All of it is switched off if the phone asks for reduced motion.

SECTION 2

The seven screens

Training · Trends · Compare · Coach · **Squad** (section 12) · Reports · Profile.

Training

- **Sync** (or pull down): Strava plus the watch (Samsung Health workouts and wellness).
- **Inbox card** appears when new activity types are waiting (see section 4).
- **Week card**: sessions, ride km, time and climbing this week vs last week, progress bars against your weekly targets, streak, form, and a chip per sport (sessions · time).
- **Readiness strip** (Samsung Health): last night's sleep, resting HR vs 30-day baseline, HRV when available.
- **Today's planned session**, tap to open the plan.
- **Sport chips** (All · Rides · Runs · Walks · Swims · Gym & other), shown when you have more than one sport. The choice also applies to Trends.
- **Search** across name, date, sport, zone and your notes; **filters** Training / Play / No intent / Needs review.
- **Workout cards** grouped by month, each titled by its number — **Ride 42**, **Run 3**, **Walk 5**, **Swim 4**; gym and other sessions count per exercise (**Strength 3**, **Padel 1**) — with its own name (Strava's, the watch's or yours) beside the date. Numbers follow the date order and update when a sport or exercise is changed. Then distance, time, speed or pace, HR, ascent (or energy for gym), load, and the zone strip. Flagged values are struck through; excluded workouts are faded.

Trends

- **Fitness · Fatigue · Form** KPIs and chart (90 days, 6 months, 1 year, all).
- **Calendar** coloured by daily load; tap a day to open it.
- **Weekly volume** by distance, time, climbing or load — stacked by sport when you train more than one.
- **Best efforts** per sport (1, 5, 20, 60 min speed/pace and HR; power only with a power meter), all-time and last 6 weeks.
- **Session-by-session progression** for one sport at a time (speed, HR, efficiency, distance, climbing, work, load), scrollable sideways, tap a point to open it.
- **AI season audit** with its own model choice.

Compare

- Pick the sport, then A and B (and optionally C). Presets: **Latest vs most similar**, **Latest vs previous**, **Latest vs best similar**.
- **Verdict**: faster/slower at what heart rate, and the efficiency change; it also says whether the two sessions are similar enough to compare fairly.
- **Paired bars** per metric with the B-vs-A difference (green = better for B), zones side by side, **overlay chart** of speed and HR along the distance (or time for swims/gym).
- **Explain the difference** asks the Compare coach; its answer is saved for that pair.

Coach

- **Aether**, the season coach (section 7), with the model line under its header and quick prompts.
- **Training plan**: this/next week, your weekly template, day changes, targets, done/missed ticks, and "Adapt with AI".
- **Session conversations**: every workout has its own coach thread.

Reports

- Period: 7 days, 30 days, 1 year, all time; activities: All or one sport.
- Sport tiles with change vs the previous period, load/efficiency/intensity panel, zone bars, all-time records per sport (each with a flag to mark it as a data error), the AI period review and the PDF (section 10).

Profile — four short groups (since 3.11)

Group	What's in it
You	Progress photos, athlete (name, height, bike), weight log, default weekly targets, training phase, heart rate & zones
Connections	Strava, Samsung Health, the web app's account, Huawei Health import, new activity types (the remembered include/skip choices)
AI coach	AI providers and keys, model per coach, coach memory, coach skills, AI spending cap
App & backup	Appearance, auto-sync, haptics, export/restore, restore points, Classic rollback, diagnostics, version and What's new

The last group you opened is remembered; links elsewhere ("set up a provider", "connect Strava") open the right group. Every workout page also has **Fix sport or data** and **Delete workout** buttons.

SECTION 3

Workout detail

Tap any workout. It grows out of its card into a full page.

- **Header**: share card image, edit intent, and the **flag** (sport, indoor, data errors, exclude, delete).
- **Badges**: sport, intent, indoor, Galaxy Watch, power meter, and red badges for anything marked as a data error.
- **Route** (outdoor GPS only) coloured by heart-rate zone; it draws itself in.
- **Hero numbers** in the sport's units; flagged numbers are struck through (tap them to change the flag).
- **How did it feel?** Feel, RPE 1–10 and a private note — all read by the coaches.
- **Biometrics**: max speed, peak HR (% of max), load, work, climbing VAM, aerobic decoupling, elapsed time, session-RPE load, and NP/IF/TSS for power-meter rides.
- **Heart-rate zones** on moving time, **vs your previous comparable sessions** (same sport and intent), **best efforts in this session**, and the **stream chart** (speed, HR, power, elevation, cadence).
- **AI coach**: analyse the session, then chat about it (screenshots allowed). The trash icon next to the title resets that thread.

SECTION 4

Where data comes from

Strava

Imported automatically	Becomes
Ride, Mountain bike, Gravel, E-bike, Virtual ride, Velomobile, Handcycle	Ride
Run, Trail run, Virtual run	Run
Swim	Swim
Elliptical, Stair stepper, Weight training, Workout, Rowing, Crossfit, HIIT, Yoga, Pilates, Hike, Rock climbing	Gym & other
Everything else (Walk, Snowshoe, football…)	Inbox — you decide

Only activities from 2026-01-01 onwards. Streams (time, distance, GPS, altitude, HR, speed, power, cadence, grade, moving, temperature) are downloaded once per workout. A Strava rate limit pauses stream downloads; the next sync continues.

Galaxy Watch via Samsung Health → Health Connect

Watch exercise	Becomes
Pool swim, open-water swim, swim	Swim (pool = indoor)
Treadmill run, run, track	Run (treadmill = indoor)
Stationary bike	Ride, indoor
Elliptical, stair climbing / stepper, rowing (machine), strength, weightlifting, HIIT, circuits, cross training, yoga, pilates, boxing, jump rope…	Gym & other
Walk, hike and other sports (≥10 min)	Inbox

Each watch session gets distance, duration, calories and a heart-rate stream from the watch's samples, so zones, load, best HR efforts and the coaches work exactly like for Strava. If the same session is also on Strava (±5 min) the watch copy is skipped — or replaced by the Strava copy later, keeping your intent, rating, note, sport and flags.

Swims, treadmill & gym: straight from Samsung Health

Samsung Health shares fewer workouts with Health Connect than it records, and no swims at all. Training Partner therefore also reads Samsung Health directly (Samsung Health Data SDK, read-only), on every sync: pool and open-water swims with distance, pool length and active swim time (pace per 100 m), treadmill and outdoor runs with heart rate and speed, the stationary bike, elliptical, rowing machine, stairs and strength sets — each with the watch's second-by-second heart rate, so zones and load are real. Outdoor rides come from Strava and rest breaks between sets are skipped; walks, squash and other types go to the inbox.

One-time setup: Samsung Health → ⋮ → Settings → About Samsung Health → tap the version 10 times → **Developer mode (Samsung Health Data SDK)** → **Developer Mode for Data Read** on; then Profile → Samsung Health → **Connect** and allow Exercise.

Fallback: Samsung Health export

Samsung Health does not share swim sessions with Health Connect (other watch workouts and heart rate do arrive). To bring swims in: Samsung Health → ⋮ → Settings → **Download personal data**; then in Training Partner, Profile → Samsung Health → **Import Samsung Health export** and pick `com.samsung.shealth.exercise….csv` from *Download › Samsung Health › newest folder*. Also selecting the files in *jsons › com.samsung.shealth.exercise* adds second-by-second heart rate

(zones, load). Sessions already in the app (±5 min) are skipped; walks, hikes and custom types go to the inbox. Repeat the export whenever you want the newest swims.

When Strava files a watch treadmill or exercise-bike session as a generic sleep with stages (counted on the morning you wake up, only asleep stages), steps, weight (optionally copied to the weight log), VO2max, HRV if shared, and resting HR. Samsung Health doesn't share resting HR, so the app estimates it as the day's **lowest hourly average heart rate** (usually during sleep), marked "estimated". 120 days are kept.

Permissions are read-only: heart rate, resting HR, HRV, sleep, steps, weight, VO2max, SpO2, respiratory rate, exercise sessions, distance, active calories, and history access. The first manual import after this update asks for the new ones once.

The inbox

Each waiting activity shows type → sport, date, distance and duration. Ticked ones are added (walks and hikes as Walks, others as Gym & other), unticked ones are skipped for good. "Every walk from now on" can be set to *Include* or *Skip*; you can change it next time the inbox opens.

SECTION 5

Wrong data, sports and deleting

Flag	Left out of
Elevation & climbing	ascent totals, "Most climbing", VAM records, climbing in compare, AI context
Distance & speed (GPS)	distance totals, speed/pace averages, top speed, speed best efforts, progression, AI context
Heart rate	HR averages, HR best efforts, zones, load (TRIMP) — so also Fitness/Fatigue/Form
Power	power, NP/IF/TSS, power best efforts, work (kJ)
Exclude the whole workout	everything (session counts, totals, load, records, compare defaults, reports); still visible, faded
Indoor	climbing always; for rides also distance and speed (a stationary bike doesn't move)

Changing the sport renumbers that sport's sessions. Deleting asks for confirmation, creates a restore point, deletes the workout, its stream and its chat, and adds it to a "deleted" list that every sync respects. Undo: Profile → Restore points.

SECTION 6

Calculations

Heart-rate zones

Five zones from your max HR and four boundaries (default for max 207: 135 / 155 / 171 / 189 bpm). Suggested boundaries are 65.2 %, 74.9 %, 82.6 % and 91.3 % of max. Zone time counts **moving** time only; gaps longer than 10 s count as 10 s.

Training load — Banister TRIMP

```
HRr = (HR − resting HR) / (max HR − resting HR), clamped 0…1
TRIMP = Σ (Δt in minutes) × HRr × a × e^(b × HRr)
a = 0.64, b = 1.92 (male) · a = 0.86, b = 1.67 (female)
```

Computed from the HR stream (all recorded time); without a stream, from average HR × moving minutes. Works for every sport, so load can be added across sports.

Fitness, Fatigue, Form

```
CTL(today) = CTL(yesterday) + (load − CTL(yesterday)) / 42      Fitness
ATL(today) = ATL(yesterday) + (load − ATL(yesterday)) / 7       Fatigue
TSB(today) = CTL(yesterday) − ATL(yesterday)                    Form
Ramp = CTL now − CTL 7 days ago     ACWR = ATL / CTL
```

Form labels: > +15 very fresh/detraining, +5…+15 fresh, −10…+5 balanced, −30…−10 productive fatigue, < −30 high fatigue.

Speed, pace, efficiency

- Average speed of a group = total distance ÷ total moving time of the same sessions (duration-weighted), computed only within one sport.
- Run pace = 60 ÷ km/h (min/km); swim pace = 6 ÷ km/h (min/100 m).
- **Efficiency** = average speed ÷ average HR × 100 (km/h per 100 bpm). Higher = more speed for the same cardiac cost. Reports use rides ≥ 20 min, weighted by duration.

Climbing VAM

Metres climbed per hour while moving on grades above 3 % (Strava's smoothed grade, or altitude/distance). Needs at least 2 minutes of climbing and 5 m of gain.

Aerobic decoupling and drift

On moving time, after skipping the first 12 minutes, the rest is split into two halves. Only for steady training sessions (intent Training, not intervals) of 30+ minutes.

```
EF = speed / HR   (power / HR with a power meter)
Decoupling % = (EF₁ − EF₂) / EF₁ × 100       Drift = HR₂ − HR₁ (bpm)
```

Best efforts

Streams are resampled to 1 sample per second; the best rolling average over 1, 5, 20 and 60 minutes is kept for speed and HR (every session) and for power (5 s … 60 min, power meter only).

Power (power meter only)

```
NP = (mean of (30-s rolling average power)⁴)^¼
FTP = your setting, or 95 % of the best 20-min power of the last 120 days
IF = NP / FTP      TSS = hours × IF² × 100
```

Strava's power estimate for rides without a power meter is shown but never used for calculations.

Intensity distribution

Low = Z1+Z2, middle = Z3, high = Z4+Z5 of zone time. Polarization index = (low + high) ÷ middle; above 2 means a polarized distribution.

Swim metrics

The watch logs every pool length: its time, stroke count and stroke style. From that the app computes:

```
Swim time = Σ length times (rest between sets excluded)      Rest = total − swim time
Pace /100 m = swim time ÷ distance × 100
SWOLF (one length) = seconds + strokes      Avg SWOLF = mean over stroke lengths (kick-board lengths
excluded)
Strokes per length = strokes ÷ stroke lengths      Stroke rate = strokes ÷ stroke-length minutes
Best 50/100/200/400 m = fastest run of consecutive lengths covering that distance
100 m splits = consecutive groups of 100 m of lengths
```

Lower SWOLF, fewer strokes per length and a lower pace mean more efficient swimming. Heart-rate zones and load come from the watch's second-by-second heart rate over the whole session.

Run and gym metrics

Runs add cadence (steps per minute, average and max), total steps and the watch's VO2max estimate; treadmill runs have no GPS climbing. Gym sessions show time, average/peak/lowest heart rate, load, calories and repetitions (when the watch counts them) — no distance or speed.

Records

Per sport, ignoring excluded workouts and flagged values: longest distance, longest time, most climbing and best VAM (rides/runs), best average speed or pace (rides ≥ 10 km, runs ≥ 3 km, swims ≥ 400 m), top speed (rides), hardest session (TRIMP), biggest week. New records after a sync trigger a toast and confetti.

Compare similarity

```
score = 1.2 × |Δdistance| + |Δduration| + 0.4 × |Δclimbing|   (each relative to the larger)
      + 0.6 if the intent differs + 0.5 if one is indoor and the other isn't
```

Below 0.5 = very similar, below 1 = reasonably similar. "Real" sessions are at least 5 minutes and 0.5 km (0.1 km swims).

Timeline given to the ride coach

Per minute (2 minutes for small models) of moving time: distance, average and **peak** speed (or best pace), average and peak HR, average and peak power, elevation and climb/descent.

SECTION 7

The AI coaches and exactly what they see

Every coach receives: date/time, its role, its **coaching skills**, the **coach memory**, the **style rules** and the **data notes** (units, estimates, flags, how load works). Then its own context:

Coach	Context
Aether (season coach)	Athlete profile, weight history, FTP, phase history · load today + weekly load trend (12 weeks) · wellness today + last 14 days · weekly template, this week and next week with done/missed, weekly targets and progress, 14-day adherence, pending proposals · season totals per sport, zone minutes, weekly totals, best efforts per sport · **data completeness** (sessions without HR, flags, nights with sleep, days with resting HR) · workouts since your last chat · **full ledger**: last 6 weeks one by one (≥ 25 sessions, each with intent, time, load, rating, VAM, drift, zones, flags, distance, speed/pace, HR, ascent, your note and the coach's verdict from that session's chat), older months summarised · last 12 messages.
Ride / session coach	Athlete profile · the planned session that day · load going in · wellness that day · that week per sport vs targets · recovery gap since the previous workout · full session block (sport, flags, distance, pace/speed, HR, power, climbing, load, intent, zones, halves, drift, best efforts, your rating and note) · minute-by-minute timeline with peaks · the previous 10 workouts of any sport · the thread (debrief + last 10 messages).
Compare	For each session: planned session, load going in, wellness, body mass, the full session block and your messages about it.
Reports	Period and scope (all or one sport) · load at period end and trend · targets and adherence · intensity distribution · period vs previous period, all sports and per sport · 14-day wellness · the ledger of the period.
Trends audit	Profile with phase history · load and trend · weekly totals · best efforts · season ledger.
Week planner	Profile · load · 14-day wellness · template · next 7 days as planned · targets · adherence · last 21 days; answers in JSON.

Model size. Small models (Groq, local, or names with lite/mini/small/nano or ≤14B) get a compact version: 12 sessions in detail, 6 previous workouts, 8 weeks, 2-minute timeline. Others: 25 sessions (up to 40 when the last 6 weeks hold more), 10 previous workouts, 12 weeks, 1-minute timeline.

Style rules (all coaches)

- Answer in the first sentence; chat replies ~150 words unless you ask for detail; debriefs/comparisons ~300 words; reviews thorough but tight.
- Calm and factual, no hype or emojis; body weight only when it matters; no closing question unless needed and never repeated.
- Only numbers from the context; never invent sessions, symptoms or events; say when data is missing or flagged; readiness without sleep/HRV/resting HR is labelled "load only".
- Lasting facts and corrections are saved with `<remember>` into the coach memory.

Coaching skills

Skill	Used by
coach-voice, intensity-zones	all coaches
load-and-readiness	Aether, session, reports, trends, planner
ride-analysis	Aether, session, compare, reports
fuel-and-recovery	Aether, session, reports, planner
mtb-terrain	Aether, session, compare

plan-design	Aether, planner
plan-actions	Aether (how to propose plan/target changes)

More skills can be imported from GitHub in Profile and switched on per coach.

SECTION 8

Models, retries and costs

- **Providers**: Google Gemini, Groq, OpenRouter, Mistral (free tiers) and Anthropic Claude, OpenAI, DeepSeek (paid), or any OpenAI-compatible endpoint. Keys stay on the phone.
- **Picker**: tap the model line in a coach → *Automatic* or a provider → its models (searchable; free/price tags; "Refresh" reloads the list). Apply to this coach or all coaches. Pick chat models — code-only models answer poorly.
- **Automatic / Use another provider**: the chosen model first, then your default, then the others (free ones first). A toast says who answered.
- **Keep retrying this one**: only that model; on rate limits, busy servers, timeouts or no connection it waits 10 s, 20 s, 40 s, 1, 2, 3, then 5 min between tries, for up to 2 hours, showing the countdown under the typing indicator. A wrong key, unknown model or bad request stops at once.
- **Timeouts**: 75 s for the first streamed word, 45 s silence while streaming, 150 s without streaming.
- **Spending**: paid providers count tokens × your prices into a monthly total; at 80 % of the cap you're warned, at 100 % paid providers stop (free ones keep working).
- **Never lost**: Aether and session chats save your message first (marked "sending"), finish in the background, notify you if you left, and retry unanswered messages (last 3 days) when the app returns or the connection comes back.

SECTION 9

Plan, targets and Aether's changes

- **Weekly template**: one session per weekday that repeats. **Day changes** override a single date (yours, the AI planner's or Aether's — each marked). A session can carry a sport.
- **Done** = a workout that day or your tick; past planned days without either show as missed.
- **Weekly targets**: km (riding), hours (all sports) and sessions — default, or for this/next week only.
- **Aether's changes** arrive as a card with Apply / Dismiss. Apply creates a restore point first. Aether proposes changes only when you ask or agree; "no bike" means other sports unless you say rest, injury or illness.
- **Adapt with AI** (planner) rewrites the next 7 days around your template, form, wellness and missed sessions.

SECTION 10

Reports and the PDF

Pick the period and the activities, write the review (optional), then **Export PDF**; it opens the share sheet. Pages:

1. Cover band, coach verdict, six KPI tiles vs the previous period, per-sport breakdown with time share, Fitness/Fatigue/Form chart.
2. Weekly training time stacked by sport, intensity donut and zone bars, recovery snapshot and best efforts, week-by-week table (sessions per sport, time, km/m, TRIMP, fitness/form, vs target).
3. One page per sport: summary line, speed/pace vs heart-rate chart, zone split, top sessions table.
4. Highlights and records set in the period, plan adherence and missed sessions, recovery log (sleep, stages, resting HR, HRV, steps, weight), data-quality notes and coach memory.
5. The AI review with numbered sections, then every session colour-coded by sport.

SECTION 11

Backups, privacy and updates

- Everything lives on the phone (IndexedDB). Backups and restore points never include API keys or Strava tokens.
- Restore points are made automatically before syncs, updates, applying plan changes, restoring a backup and deleting a workout; up to six automatic and six manual are kept.
- Updates install over the old version (same signing key), so data stays. Classic (v2) interface remains available as a rollback.
- USB debugging of the app's WebView is enabled for diagnostics; it only works from a computer you've authorised for USB debugging.

SECTION 12 · NEW IN 3.5

Squad — training together

The **Squad** tab is a small app of its own for a challenge with a friend (two people for now) (made for training with Assad: iPhone, Huawei Watch Fit 5 Pro, mostly walking and swimming). Your personal side stays exactly as it was — the squad only receives **summaries**. Walks are now their own sport too (Walk : pace /km, steps, cadence) instead of counting as runs.

The sections

Section	What it shows
Home	Total points (each against his own usual), who trained today, the chat preview, quick actions (add from screenshot, log weight, ask Aether), this week's score cards, Aether's latest recap, latest workouts.
Chat	3-way chat: you, your friend(s) and Aether. Workouts appear inline. Tap a message or workout to react, reply, or ask Aether for a **review** or a **roast**. Mention `@Aether` to ask anything.
Feed	Every shared workout by day, filter by person or sport; reactions and comments; open one for all its numbers (every swim length too).
Stats	Per-person table (last 4 weeks or whole challenge), points per week, minutes per week against each person's own usual (dashed), pace against own usual, weekly duels, sport mix, time of day, training calendar, and — for those who share it — weight change, steps, resting HR and sleep; personal bests.
Report	Monthly report per person (workouts, active days, time, distance, load, best streak, PBs, weight change, sleep, steps, sports), minutes per day, "on track vs own usual", points per week, Aether's written monthly report and a **PDF**. Since 3.8 also one 🏁 chip per finished arc (section 16).
Crew	Each person's profile and baseline (what he is measured against), wins, streaks, PBs; challenge rules; invite code; **Start Arc N** (section 16); settings; leave.

Fair scoring — everyone against himself

Different bodies, sports and starting points never decide the winner. Each person's **baseline** comes from his own 4 weeks before the challenge (or his first challenge week).

```
weekly points = consistency 40 × min(active days / own target, 1)
              + volume 30 × min(minutes / own usual, 1.5) / 1.5
              + improvement 30 × (0.5 + clamp(pace better than own usual / 5 %, −1, 1) / 2)
              + bonuses: PB +5 each (max 15) · streak day of 3+ in a row +1 (max 7) · over target +3
```

Improvement uses swim pace /100 m, walk and run pace /km and ride speed, weighted by minutes per sport. The higher relative score wins the week (**weekly duel**); the month goes to the higher average weekly points. Weight is never compared: graphs, the PDF and Aether only ever see each person's **change**.

What is shared

- Automatically after every sync, for workouts from the challenge start: sport, date and time, duration, distance, pace/speed, heart rate, load, SWOLF and every swim length, cadence, steps, climbing, personal bests (vs your own earlier workouts of that sport, after 3 of them).
- Unless switched off: how it felt (RPE), your note and the first sentence of your coach's debrief.
- Only if switched on (opt-in): weight, resting HR, HRV, sleep and daily steps. Switching it off removes them from the squad.
- Editing or deleting a workout updates or removes it in the squad too.

Aether in the squad

One strong model with the challenge owner's key, kept on the squad server (friends never see the key; the monthly spend cap applies). It answers `@Aether`, Review, Roast and the monthly report, and it can **chime in on its own** — personal bests, streaks, a first workout, someone quiet for 3 days, or a long chat without it — but never within 90 seconds of someone writing, at most once per 2 hours and 4 times a day, and it may stay silent. A daily recap arrives at the chosen hour (the last day of each week also announces the duel), and a final recap when the challenge ends. Only one AI reply is written at a time; replies are attached to the message they answer. Roasts are about the workout, never about bodies, weight, health or anything personal.

Sync — never stops working

The squad server is a Cloudflare Worker with a D1 database on the free plan: serverless, nothing pauses after hours or days without use. Your posts go into an outbox first, so closing the app or losing signal never loses them, and a retry can never post twice. The app checks for news every 4 s while the chat is open, every 15 s on the Squad tab, every minute elsewhere and immediately when the app opens.

Your friend on iPhone

1. Open the invite link in Safari → Share → **Add to Home Screen**. The **introduction** opens: his **account** (section 15), name, age and heart rate (his own zones), weight, his Huawei history, joining the challenge and a free Google Gemini key for his coaches.
2. Workouts from **Huawei Health** (no Strava): screenshots or the Log form (section 14), and the Huawei data export for history (section 13).

SECTION 13 · NEW IN 3.6

Huawei watches, the introduction and the web app

Importing from Huawei Health

1. Huawei Health app → **Me** → your name → **Privacy Center** → **Request your data** → tick **Health** → set a password → send.
2. Huawei e-mails a download link (minutes to hours). Download the ZIP (iPhone: Files → Downloads).
3. Profile → **Huawei Health** → Import: pick the ZIP, enter the password (it can be remembered on the phone).

Every session in the export is imported: sport, local start time, duration, distance, calories, a heart-rate stream (zones and training load), the GPS route, speed, steps and cadence, climbing, and for pool swims every length with its time, strokes and SWOLF (best 50/100/200/400 m, splits, the per-length chart — the same as Galaxy Watch swims). Sessions already in the app, deleted ones and those before 2026 are skipped, so importing a newer export later only adds the new ones.

Huawei sport	In the app
Walk, hike, mountain hike	Walk
Run, cross-country run · indoor run	Run · treadmill
Cycling · indoor cycling	Ride · indoor ride
Pool swim · open-water swim	Swim (pool with lengths)
Cross trainer, CrossFit, other	Gym & other

Automatic daily sync straight from Huawei needs Huawei's developer approval (Health Kit) and is planned; Apple Health was checked and not used because Huawei rarely passes workouts to it and never pool lengths.

The introduction

Shown once on a new phone or the web app (never on a phone that already has workouts) and any time from Profile → **Introduction**. Max heart rate is estimated from age (208 − 0.7 × age) unless entered; the zone limits are then set at 65 %, 75 %, 83 % and 91 % of that max, so zones, load and coaching fit the person.

The web app's AI

On the iPhone web app the personal coaches use Google Gemini only (one free key). In each coach's model choice: **Use another Gemini model** (if the chosen one is busy or out of free quota) or **Keep retrying this one** (waits and retries until it answers). Strava is not part of the web app: new Strava API apps need a paid plan, and the owner's Strava connection stays his own.

Everything the web app uses is free: the Cloudflare free plan for the server and the web app, a free Gemini key, and Huawei Health's own export.

SECTION 14 · NEW IN 3.6–3.9

Screenshots and logging by hand

Huawei Health can't send workouts to the web app on its own, so a session gets in by **screenshots** (the main way) or the **Log** form. Both open from Training (Screenshot · Log) and from Squad's quick actions.

Screenshots — automatic (3.9)

1. Tap **Screenshot** and pick up to **8 screenshots** at once — the summary, the heart-rate, pace, elevation and cadence graphs, splits, swim lengths, zone times. They may belong to several workouts.
2. One AI call groups the screens per workout, reads every number, every table row and the shape of every graph, and names the exercise (walk, pool swim, treadmill, rowing, padel…). It uses the person's own free Gemini key when set up, otherwise the squad's Aether.
3. **Every workout that reads cleanly is saved straight away** — numbered, charted and shared with the squad — and a message lists what was added (e.g. "Walk 5 (4.50 km · 45:00)"). A graph or table that disagrees with the summary (see the checks below) is simply left out; the summary numbers are what the screen states.
4. Only a workout with **no date, no start time, no duration or no distance**, a guessed year, an average heart rate above the maximum, or a pace that contradicts distance and time opens the **check screen**: the numbers (all editable), the screenshots, a preview chart, the tables read, include-toggles and the checks. Save, or fix and save.
5. Something wrong anyway? Open the workout in Training → flag → change the sport or exercise, mark a value as a data error, or delete it and log it by hand.

Check	What it catches · what happens automatically
Splits vs duration and distance	a split row read wrong or missing · splits left out
Pool lengths vs distance and time	missing or doubled lengths · lengths left out
Heart-rate graph average vs summary	a graph misread · graph left out (average and max HR kept)
Zone times vs duration	zone minutes that don't add up · zone times left out
Pace vs distance ÷ time; average HR above max	a misread distance, time, pace or heart rate · opens the check screen
No date on the screen / date in the future	Huawei shows "Oct 28" without a year: the AI is told today's date and picks the latest such date that isn't in the future (a future date is moved back a year); a missing date opens the check screen
Reply cut short	very long reads: the workouts that came through completely are kept, with a warning

What a saved screenshot workout contains

- The graph curves become a 10-second stream: heart rate (so zones and training load are real), speed scaled so it matches the summary distance, altitude and cadence — the same charts as any other workout.
- Pool swims: every length (time, strokes, stroke, SWOLF) in the same per-length model as watch swims — best 50/100/200/400 m, splits, the per-length chart.
- Watch extras kept with the workout: lowest HR, max cadence, stride, descent, VO2max, training effect, recovery time, zone minutes, splits.
- **Moving time**: when the screens show both total and moving time, pace and speed use the moving time (4.5 km in 45:00 moving = 6.0 km/h, even if the total with stops was 50:00); the total is kept as elapsed time.
- **Zones without a graph**: when there is no usable heart-rate graph but the screen lists time per heart-rate zone, each zone's minutes go into the person's own zone its bpm range falls in.
- Also kept: the watch's training load, best pace and stroke rate.

Screenshots are read at up to 2000 px on the long side so small graph labels stay readable.

Log a workout by hand — no screenshot needed

Training → **Log** starts with **What did you do?** — pick one exercise:

Group	Exercises
Walk & run	Walk, Hike, Treadmill walk, Run, Trail run, Treadmill run
Swim	Pool swim, Open-water swim
Ride	Ride, Mountain bike, Indoor bike
Gym & sports	Strength, Aerobics, Elliptical, Rowing, Stair stepper, HIIT, CrossFit, Yoga, Pilates, Core & stretching, Football, Basketball, Tennis, Padel, Squash, Badminton, Boxing, Martial arts, Dance, Jump rope, Climbing, Workout (anything else)

Then the fields for that sport: **swim** (pool length × lengths → distance, main stroke, HR, calories, SWOLF, strokes), **walk / run** (distance, steps, cadence, climbing, HR, calories), **ride** (distance, climbing, power, cadence, HR, calories), **gym & sports** (HR, calories, reps, optional distance). All have date, start, duration, effort (RPE 1–10) and a note, with a live pace/speed preview. Indoor follows the exercise (pool, treadmill, indoor bike, gym and court sports). The exercise can be changed any time with **Change**; "Have screenshots?" switches to the automatic reader.

SECTION 15 · NEW IN 3.8

Web accounts — the same app on every device

On the web app (Assad's iPhone) everything lives in the browser. An **account** keeps it safe and lets him open the app on another phone, tablet or computer with everything there. The Android app doesn't use accounts — its data stays on the phone with backups and restore points as before.

- **Required in the introduction**: Welcome → **Account** → **About you** → Huawei history → Squad → AI coach → Done. There's no Skip until the account and About you are done.
- **Username + password.** From the password the device makes two keys: one to sign in (the server only keeps a fingerprint of it) and one to encrypt — the encryption key **never leaves the device**.
- **Everything is backed up**: workouts, streams, coach chats, settings (including his Gemini key), squad membership. It is compressed, encrypted on the device, then uploaded — 2 minutes after a change and whenever the app is closed or hidden. The server stores only scrambled data it cannot read.
- **Another device**: sign in with the same username and password; everything comes back.
- **Two devices at once**: if one device uploaded while the other still had a new workout, the newer copy is pulled first and the local workout is merged in and uploaded again — nothing is lost.
- **Wrong passwords**: 8 in a row lock the account for 15 minutes. A forgotten password can't be recovered (nobody, including the server, can decrypt the data) — write it down.
- **Sign out** (Profile → Account): warns if the last backup failed, and offers **Remove from this device** — for a borrowed phone.

The server is private to two people: it accepts 2 accounts, 2 members per challenge and 3 challenges, so strangers can't fill the free storage.

SECTION 16 · NEW IN 3.8

Arcs — starting fresh together

An **arc** is one round of the challenge. When you both want a clean slate — a new season, after a break, or just for fun — start the next arc.

1. Squad → Crew → **Start Arc N** (asks to confirm).
2. A banner appears for both of you with who has approved (✓ / ⏳) and **Approve** · **Not now** · **Call it off**.
3. When **everyone** has approved, the challenge restarts **today**: points, streaks and weekly duels start from zero, the Home, Feed and Chat show only the new arc (earlier workouts and messages are one tap away).
4. Every device plays the **ARC N** animation once: a light streak, the old number glitches and shatters, the new number slams in with a screen shake, shockwave rings, light rays, sparks and embers, confetti cannons, the crew flies in with a VS — and from Arc 2 the **champion of the last arc** with the final score. Tap to close. On the Android phone it vibrates on the big moments; with reduced motion it stays calm.

The end-of-arc report (from Arc 2 on)

- The arc that ended is archived with its dates and a **snapshot of each person's "own usual"** at that time, so its scores and champion never change afterwards.
- The new arc measures everyone against his **last 4 weeks** (the baselines refresh).
- Aether writes a thorough **end-of-arc report and analysis** in the squad chat: the winner on relative points, and for each person volume, consistency against his own target, improvement against his own usual, personal bests, streaks, best and weakest sessions, patterns (days, times, sports) and — supportively — shared wellness; the story of the weekly duels; one funny award each; 3 concrete goals per person for the next arc.
- Squad → Report gets a 🏁 chip per finished arc: the arc's own points, weeks won, graphs, the AI analysis and a **PDF**. Workouts from earlier arcs stay shared so those reports keep working.
- Each arc gets its own final recap at its end, and a monthly report in the month an arc starts counts only from the arc's first day.

SECTION 17 · NEW IN 3.10

Battles — progress races

Squad → Home → ⚔️ **Battles**. Two kinds, both live as soon as workouts are shared.

This week (automatic)

A tug-of-war bar per number — whoever is further along pulls the bar his way, and a 👑 marks the leader. Everyone is measured against **his own** usual, so different bodies and sports battle fairly:

Bar	Each person's number
Active days	days with a workout ÷ his own target days (e.g. 3/4 = 75 %)
Minutes	minutes this week ÷ his usual weekly minutes
Improvement	improvement points (pace/speed vs his own usual, out of 30)
Points	this week's total points (section 12)

Challenges (you start them)

1. **New battle** → pick a template (most minutes this week, most active days, first to 20 km, first to 2 km swimming, most workouts in 2 weeks) or set your own: what counts, the sport, the target, how the winner is decided, when it ends and an optional **stake** ("loser buys coffee").
2. Your friend sees "**… challenged you**" with **Accept** / **Not this one**, and the chat shows it. Workouts from the battle's first day count, even if he accepts later.
3. Both progress bars race toward the target (🏁 when someone gets there). The winner gets confetti; finished battles stay on Home for two weeks. Only the one who started a battle can call it off.

Setting	Meaning
What counts	minutes · active days · workouts · distance in km (not swims) · swim distance in m — optionally one sport only
Target: each vs his own usual	for minutes, days and workouts: each person's target is his own usual for the battle's length (usual weekly minutes or target days × days ÷ 7) — the fair default
Target: same number for both	one number for everyone (needed for km and swim metres)
Winner: first to reach the target	decided by the date and start time of the workout that crossed 100 %
Winner: best at the end	the highest % on the last day; equal % is a draw

SECTION 18 · NEW IN 3.11

Progress photos

Open them from **Squad** → **Home** → **Photos** or **Profile** → **You** → **Progress photos**. Three tabs: **Mine**, your friend's shared ones (with his name) and **Compare**.

Private first

- A photo is kept **only on your phone** (its own storage, about 1280 px). On the iPhone web app it is also in your encrypted account backup, so your other devices get it; nobody else can open that backup.
- **Share with your friend** — when adding, or later from the photo — uploads a smaller copy to the squad server, visible only to the members of your challenge, and shows it in the chat. **Unshare** deletes it from the server again; leaving the challenge deletes all photos you shared there. Up to 60 shared photos each.
- On the Android phone, photos are not part of the exported JSON backup or restore points — keep the originals in your gallery if they matter.

Taking them

Pick the pose (front, side, back, other), the date and an optional note. Same place, same light, same distance and pose every time make the comparison honest; after 3 weeks without a photo the screen reminds you.

Compare

- Choose **Before** and **After** (default: your latest photo against your first one of the same pose) and drag the slider across the picture.
- Below: days apart, the weight change (from your weight log, within a week of each photo) and the workouts and hours in between.
- **AI review**: a supportive coach describes the visible changes (posture, shoulders, arms, back, waist, legs, definition), says when light or angle make it unreliable, and gives 2 tips for the next photo and 1 training focus. 🔥 **Roast**: a friendly gym-buddy roast of the photos themselves — the pose, the mirror, the lighting, the effort — ending with a real compliment.
- Both never comment on attractiveness, never guess body fat, health or medical issues and never shame weight or size. They run on your phone with your own AI key — a model that reads images is needed (Google Gemini is free and used first). **Post to the squad chat** shares the verdict text.
